

Acoustics Software IP Bass Boost Solution

Socionext has developed "bass boost technology" that enables even small thin speakers, which cannot reproduce notes in the low frequency register, to reproduce rich sounds that give you a sense of presence.

With this technology, you can significantly enhance the sound quality of existing systems without having to modify the hardware.

■ Features

- Extends the audible range of the human ear in the bass using the characteristics of the hearing of the human ear (the missing fundamental)
- Reproduces pseudo bass sounds by complementing missing continuous harmonics in the low frequency register
- Enables low cost compact and thin speakers with a narrow band of frequencies to reproduce rich sounds that give a sense of presence

■ Applications

You can apply this technology to various types of audiovisual equipment, including digital TVs, notebook computers, mobile devices, and other wide ranging products.

■ The Principle of this Technology

■ Example of Proposed Solution

-Sound quality improvement in small, thin speakers-
